Amendments to the Claims:

1 - 2. (canceled)

3. (previously presented) A method of detecting an imprint of a postal indicium at a location on a mail piece, comprising the steps of:

utilizing a sensor to scan along a band on the mail piece to detect a sequence of transitions between areas of light and dark reflectance within the band, the band extending across the location; and

generating an indication of a presence of the imprint of the postal indicium in response to detection of a transition succeeding a predetermined number of initial transitions at a start of the sequence of transitions.

4. (previously presented) A method according to claim 3, wherein the postal indicium includes an area in which postal data is printed in machine readable, two dimensional or data matrix form.

5. (previously presented) A method according to claim 3, wherein the postal indicium includes cryptographic data.

6. (currently amended) A method of processing mail, comprising the steps of:

feeding a mail piece past a print head that normally is operable to print a postal indicium on the mail piece; and subsequently

subsequently feeding the mail piece past detection means for detecting the said imprint of the postal indicium, the said detection means scanning a band on the mail piece to detect a sequence of transitions between areas of light and dark reflectance within the band[[;]], and generating an indication of a presence of the imprint of the postal indicium in response to detection of a transition succeeding a predetermined number of initial transitions at a start of the sequence of transitions.

7. (currently amended) A method according to claim 6, further comprising  
a the step of:

stopping the feeding of further mail pieces past the print head in the event that  
no postal indicium is detected on the mail piece.

8. (previously presented) Apparatus for imprinting postal indicia on mail pieces,  
comprising:

printing means operable to print a postal indicium in a required location on the  
mail piece;

a first sensor responsive to reflectance transitions between areas of light  
and dark reflectance along a band of the mail piece extending across the location to  
generate a sequence of first signals corresponding respectively to reflectance  
transitions along the band; and means operative in response to a first signal occurring  
after a predetermined number of the first signals at a start of the sequence to  
generate a second signal indicative of an imprint of the postal indicium on the mail  
piece.

9. (previously presented) Apparatus according to claim 8, further comprising:  
a second sensor upstream of the first sensor and between the first sensor and a printing  
head of the printing means, wherein the second sensor is a reset sensor operatively  
linked to a counter for counting the number of the first signals, and configured to  
detect a leading edge of each mail piece and produce a signal to reset the counter.
